jeune des solutions de messagerie collaborative décrites dans ce quide. Disponible depuis 2012, cette solution est avant tout pensée pour ne proposer à l'écran que les fonctions essentielles tout en gardant un aspect épuré et moderne. Dans un second temps l'utilisateur et les administrateurs ont le choix d'accéder à des fonctions plus élaborées et au besoin plus ponctuel. Pour les logiciels. Thunderbird et Outlook. Blue Mind fourni en plus des connecteurs permettant de synchroniser les contacts et calendrier (ou un accès aux calendriers pour Thunderbird).

La solution repose sur une base de données principale et les fondations techniques employées par Blue Mind sont toutes au jour des dernières technologies. Ainsi la solution propose nativement la gestion du webmail déconnecté, des périphériques mabiles et une API SOAP complète et accessible permettant d'envisager le développement d'interfaces métier. Du reste, elle s'appuie sur les logiciels libres préexistants: Postfix, cyrus IMAP, ROundoube, Apache, Tomcat, nginx, HometQ, PostgreSQL. Globalement, Blue Mind propose aujourd'hui un produit jeune, esthétique, intelligent, simple dans son utilisation et son administration et sans fioritures. Il répondra à la plupart des besoins collaboratifs de base pour une entreprise.

Some trends in open source

- Open source at the forefront
- More and more 'enterprise', ie non-open source versions
- Patent trolls are under attack
- Openstack fosters a new bash of mutualized R&D

Trend #1

Big software vendors used to drive innovation in IT

Now large software consumers do much of the work

Giant software consumers are feeding open source R&D

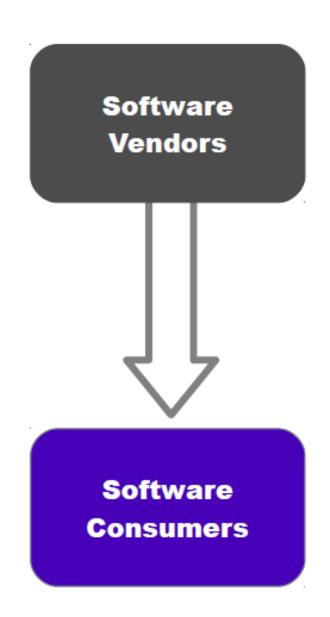

They operate at a scale never seen before

They need cheap software

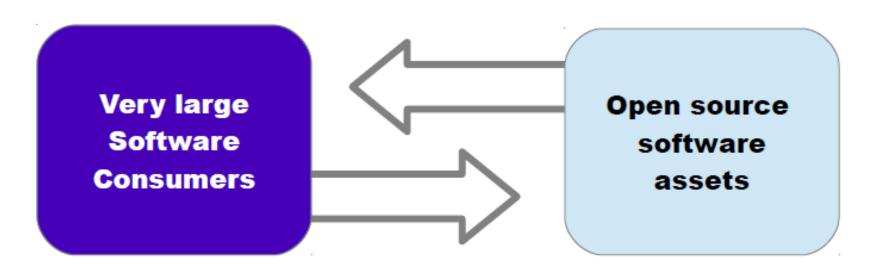

They must have full control over the technologies they use

They lead in taking the software industry forward

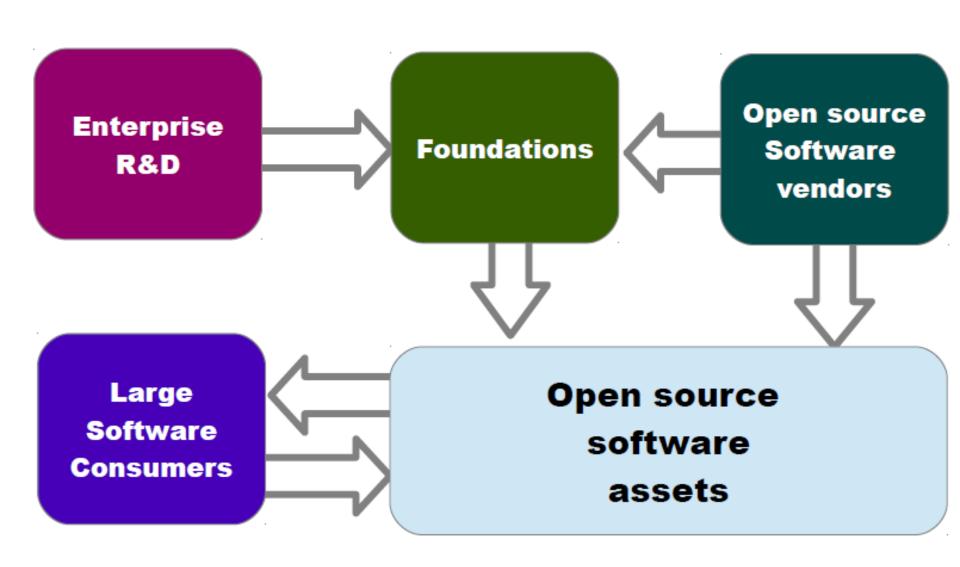

Giant software consumers

Google, Facebook, Twitter et al.

To them, IT is not a revenue, it's an expense

They depend on open source and they need to take it to the edge

Trend #2

Software is tainted

We cannot live with software we don't trust

Free software will be key to re-building trust

Snowden revelations

It used to be a paranoid nightmare, now we know it's true:

Spy agencies will get what they order from any enterprise:

private data,
as well as planted vulnerabilities

Software is vital

Software is not just useful, Lives depend on software, more so every day Software is vital, critical to many industries What happens if we can't trust software to do what it should do?

How fragile we are!

- Stuxnet showed 2 things:
 - (1) the incredible power of software, that may disrupt an industry
 - (2) the incredible frailty of those who do not control the software they depend on

Taking control back

Can we live in a world where software cannot be trusted?

No we can't!

More than ever, we will need to control the software that controls us

This is what free software is about

(re) building trust in software

We can live with bugs, we cannot live with planted malware

Dependable software 2.0:

- It needs to be open, auditable and strutinized
- It's development itself must be tracable

It has to be free software

Thanks!
